Meridian Learning: feedback that teaches

01 / Executive summary

A fictional business scenario about learners accept polished answers without understanding them, using a guided feedback loop that asks learners to explain decisions.

02 / Background & the business question

In this fictional scenario, learners accept polished answers without understanding them. The purpose of the example is to turn this business difficulty into a concrete question about AI, work, and organizational design. The organization and all circumstances are invented.

03 / An illustrative intervention

The fictional team tries a guided feedback loop that asks learners to explain decisions. Roles, review checkpoints, and exception routes are defined before the trial. A comparison workflow is kept so that apparent improvements can be examined rather than assumed.

04 / Measurement & evaluation

A possible evaluation would examine retention, transfer, and independent problem solving. It would account for review time and recovery from errors, not just initial production speed. No measurements have actually been collected for this illustrative case.

05 / Illustrative outcome & limitations

In the invented narrative, clearer handoffs make some decisions easier to review, while unusual cases still require experienced judgment. This is a hypothetical outcome, not empirical evidence. The example cannot establish that AI caused an improvement.

06 / Discussion & takeaways

What would count as a worthwhile improvement in this scenario? Which tasks should remain with people? Use retention, transfer, and independent problem solving as a starting point, identify a stop condition, and check whether benefits survive independent review.
