Cedar Supply: agents in procurement

01 / Executive summary

A fictional business scenario about buyers manually compare fragmented supplier quotes, using bounded comparison agents with human approval of orders.

02 / Background & the business question

In this fictional scenario, buyers manually compare fragmented supplier quotes. The purpose of the example is to turn this business difficulty into a concrete question about AI, work, and organizational design. The organization and all circumstances are invented.

03 / An illustrative intervention

The fictional team tries bounded comparison agents with human approval of orders. Roles, review checkpoints, and exception routes are defined before the trial. A comparison workflow is kept so that apparent improvements can be examined rather than assumed.

04 / Measurement & evaluation

A possible evaluation would examine comparison accuracy, traceability, and exception handling. It would account for review time and recovery from errors, not just initial production speed. No measurements have actually been collected for this illustrative case.

05 / Illustrative outcome & limitations

In the invented narrative, clearer handoffs make some decisions easier to review, while unusual cases still require experienced judgment. This is a hypothetical outcome, not empirical evidence. The example cannot establish that AI caused an improvement.

06 / Discussion & takeaways

What would count as a worthwhile improvement in this scenario? Which tasks should remain with people? Use comparison accuracy, traceability, and exception handling as a starting point, identify a stop condition, and check whether benefits survive independent review.
