Aster Services: an AI knowledge desk

01 / Executive summary

A fictional business scenario about support staff repeatedly search disconnected manuals, using a source-linked assistant with an explicit escalation path.

02 / Background & the business question

In this fictional scenario, support staff repeatedly search disconnected manuals. The purpose of the example is to turn this business difficulty into a concrete question about AI, work, and organizational design. The organization and all circumstances are invented.

03 / An illustrative intervention

The fictional team tries a source-linked assistant with an explicit escalation path. Roles, review checkpoints, and exception routes are defined before the trial. A comparison workflow is kept so that apparent improvements can be examined rather than assumed.

04 / Measurement & evaluation

A possible evaluation would examine answer accuracy and time to a verified resolution. It would account for review time and recovery from errors, not just initial production speed. No measurements have actually been collected for this illustrative case.

05 / Illustrative outcome & limitations

In the invented narrative, clearer handoffs make some decisions easier to review, while unusual cases still require experienced judgment. This is a hypothetical outcome, not empirical evidence. The example cannot establish that AI caused an improvement.

06 / Discussion & takeaways

What would count as a worthwhile improvement in this scenario? Which tasks should remain with people? Use answer accuracy and time to a verified resolution as a starting point, identify a stop condition, and check whether benefits survive independent review.
